

10 Authentication methods for secure eSignature transactions

1

Email authentication

The signer is sent an email, inviting them to access the eSign ceremony by clicking a link. Authentication happens with a successful login to the email account.

2

Login credentials

The signer is authenticated by the sending party's system prior to accessing the transaction. Login requires a valid user ID and password.

3

SMS OTP

Verify your signer's identity via a secure one-time SMS code sent to their phone. The signer enters the code into the login page to access the documents that require signature.

4

Secret challenge question

The signer must successfully answer challenge questions. These are referred to as "shared secrets" because the question and the answer sets are pre-selected ahead of time.

5

Digital verification

Verify unknown individuals remotely using government-issued IDs (e.g. driver's license, passport, etc.). OneSpan Sign leverages digital identity verification to extract and analyze ID data in order to confirm the signer's identity.

6

Biometric comparison

Typically used for high risk, high value transactions with unknown signers. Signers take a selfie and it will be compared against the photo on the government-issued ID document to verify their identity in seconds. Passive and active liveness detection help confirm that the person is real.

7

Knowledge-based authentication

OneSpan Sign is integrated with a 3rd party service like Lexis Nexis to present the signer with challenge questions in real time, based on data in consumer databases.

8

Smart cards and derived credentials

Federal workers use smart cards or mobile credentials that contain an embedded digital certificate. To access it, users authenticate via a PIN and sometimes biometrics.

9

Digital certificates

Issued by 3rd parties like Trust Service Providers (TSP) and Certificate Authorities (CA), digital certificates are used at the time of signing to validate the user's identity.

10

Passkeys

FIDO-based passkeys provide strong multi-factor, phishing-resistant authentication using mobile device-based biometrics. Passkeys work exceptionally well for frequent signers.

Definition of authentication

Used alone or in combination, authentication methods verify a person's identity to participate in a trusted transaction.

Categories of authentication

KNOW
Something you know

HAVE
Something you have

ARE
Something you are

Examples of eSignature authentication

Channel

Transaction

Sample authentication method

Channel

Mortgage application

Banking portal login credentials or valid email address + SMS OTP or passkeys

Online

Internal employee review

SSO

Channel

Vendor contract

SMS OTP or passkey

Mobile

Bank account opening

ID verification with biometric comparison or KBA (new customer)

Call center

Government employee procedure (vacation request)

SSO (federal employees also use a smart card or derived credential)

Insurance claim

Valid email address or customer portal login credentials

Whether you are configuring an automated eSignature workflow via API or manually sending a one-off request for signature, adding authentication is a simple yet powerful step to secure your digital agreements, data, and reputation.

OneSpan provides security, identity, electronic signature, and digital workflow solutions that protect and facilitate digital transactions and agreements. The Company delivers products and services that automate and secure customer-facing and revenue-generating business processes for use cases ranging from simple transactions to workflows that are complex or require higher levels of security. Trusted by global blue-chip enterprises, including more than 60% of the world's 100 largest banks, OneSpan processes millions of digital agreements and billions of transactions in 100+ countries annually.
